

Errata

Title & Document Type: 331A/332A Distortion Analyzer Operating and Service Manual

Manual Part Number: 00331-90006

Revision Date: April 1971

HP References in this Manual

This manual may contain references to HP or Hewlett-Packard. Please note that Hewlett-Packard's former test and measurement, semiconductor products and chemical analysis businesses are now part of Agilent Technologies. We have made no changes to this manual copy. The HP XXXX referred to in this document is now the Agilent XXXX. For example, model number HP8648A is now model number Agilent 8648A.

About this Manual

We've added this manual to the Agilent website in an effort to help you support your product. This manual provides the best information we could find. It may be incomplete or contain dated information, and the scan quality may not be ideal. If we find a better copy in the future, we will add it to the Agilent website.

Support for Your Product

Agilent no longer sells or supports this product. You will find any other available product information on the Agilent Test & Measurement website:

www.tm.agilent.com

Search for the model number of this product, and the resulting product page will guide you to any available information. Our service centers may be able to perform calibration if no repair parts are needed, but no other support from Agilent is available.

OPERATING AND SERVICE MANUAL

DISTORTION ANALYZER

Figure 1-1. Models 331A/332A Distortion Analyzers

SECTION I

GENERAL INFORMATION

1-1. DESCRIPTION.

1-2. The Hewlett-Packard Models 331A and 332A Distortion Analyzers are solid state instruments for measuring distortion and ac voltages. The Model 332A includes a high impedance AM detector which operates from 550 kHz to greater than 65 MHz.

1-3. Distortion levels of 0.1% to 100% full scale are measured in seven ranges for any fundamental frequency from 5 Hz to 600 kHz; harmonics are indicated up to 3 MHz. The high sensitivity of these instruments requires only 0.3 V rms for the 100% set level reference. An output is provided at the OUTPUT connectors for monitoring the distortion with an oscilloscope, a true rms voltmeter, or a wave analyzer. The instruments are capable of a dc isolation voltage of 400 volts above chassis ground.

1-4. The transistorized voltmeter contained in the Model 331A and 332A can be used separately for general purpose voltage and gain measurements. The voltmeter has a frequency range of 5 Hz to 3 MHz (20 Hz to 500 kHz for 300 μ V range) and a voltage range of 300 μ V to 300 V rms full scale.

1-5. The AM detector included in the Model 332A is a broadband dc restoring peak detector consisting of a semiconductor diode and filter circuit. AM distortion levels as low as 0.3% can be measured on a 3 V to 8 V rms carrier modulated 30% in the standard broadcast band, and lower than 1% distortion can be measured at the same level of the carrier up to 65 MHz.

1-6. ACCESSORY FEATURES.

1-7. The accessory available with the 331A and 332A Distortion Analyzers is a voltage divider probe, -hp- Model No. 10001A. The features of the probe are:

- a. 10 megohm shunted by 10 pF.
- b. 10:1 attenuation dc to 30 MHz bandwidth.
- c. 2% division accuracy.
- d. 600 V peak input.
- e. 5 nsec rise-time.

1-8. OPTION.

1-9. Option 01 is a standard -hp- Model 331A or 332A with a special meter and meter amplifier; compensated to permit response to VU (volume units) characteristics.

1-10. INSTRUMENT IDENTIFICATION.

1-11. Hewlett-Packard uses a two-section serial number. The first section (prefix) identifies a series of instruments. The last section (suffix) identifies a particular instrument with the series. If a letter is included with the serial number, it identifies the country in which the instrument was manufactured. If the serial prefix of your instrument differs from the one on the title page of this manual, a change sheet will be supplied to make this manual compatible with newer instruments. All correspondence with Hewlett-Packard should include the complete serial number.

Table 1-1. Specifications

MODEL 331A				Fundamental Input Greater Than 30 V			
DISTORTION MEASUREMENT RANGE				RANGE	$\pm 3\%$	$\pm 6\%$	$\pm 12\%$
Any fundamental frequency, 5 Hz to 600 kHz.				100% to 0.3%	10 Hz 300 kHz	10 Hz 500 kHz	10 Hz 3 MHz
Distortion levels of 0.1% to 100% are measured full scale in 7 ranges.				0.1%	30 Hz 300 kHz	20 Hz 500 kHz	10 Hz 1.2 MHz
INPUT LEVEL FOR DISTORTION MEASUREMENTS				Elimination Characteristics:			
0.3 Vrms for 100% set level (up to 300 V may be attenuated to set level reference).				Fundamental Rejection >80 dB			
DISTORTION MEASUREMENT ACCURACY				Second Harmonic Accuracy for a fundamental of:			
Harmonic measurement accuracy (full scale).				5 Hz to 20 Hz : better than +1 dB			
Fundamental Input Less Than 30 V				20 Hz to 20 kHz: better than ± 0.6 dB			
RANGE	$\pm 3\%$	$\pm 6\%$	$\pm 12\%$	20 kHz to 100 kHz: better than -1 dB			
100% to 0.3%	10 Hz 1 MHz	10 Hz 3 MHz		100 kHz to 300 kHz: better than -2 dB			
0.1%	30 Hz 300 kHz	20 Hz 500 kHz	10 Hz 1.2 MHz 600 kHz	300 kHz to 600 kHz: better than -3 dB			
DISTORTION INTRODUCED BY INSTRUMENT:				>-70 dB from 5 Hz to 200 kHz			
				>-64 dB from 200 kHz to 600 kHz			

CH 3

Table 1-1. Specifications (Cont'd)

DC ISOLATION

Signal ground may be ± 400 Vdc from external chassis.

VOLTMETER RANGE

300 μ V to 300 V rms full scale (13 ranges), 10 dB per range.

VOLTMETER FREQUENCY RANGE

5 Hz to 3 MHz (300 μ V range: 20 Hz to 500 kHz).

VOLTMETER ACCURACY:

RANGE	$\pm 2\%$	$\pm 5\%$
300 μ V	30 Hz 300 kHz	20 Hz 500 kHz
1 mV to 30 V	10 Hz 1 MHz	5 Hz 3 MHz
100 V to 300 V	10 Hz 300 kHz	5 Hz 500 kHz

Meter indication is proportional to average value of waveform.

FREQUENCY CALIBRATION ACCURACY

Better than $\pm 5\%$ from 5 Hz to 300 kHz
Better than $\pm 10\%$ from 300 kHz to 600 kHz

INPUT IMPEDANCE

Distortion Mode: 1 M Ω $\pm 5\%$ shunted by <70 pF.
Voltmeter Mode:

1 M Ω $\pm 5\%$ shunted by <30 pF (331A only),
1 M Ω $\pm 5\%$ shunted by <35 pF (332A only),
1 to 300 V ranges; 1 M Ω $\pm 5\%$ shunted by <70 pF,
300 μ V to 0.3 V ranges.

NOISE MEASUREMENTS

Voltmeter residual noise on the 300 μ V range:
<25 μ V rms terminated in shielded 600 Ω ; <30
 μ V rms terminated in shielded 100 k Ω .

OUTPUT

20 Hz - 600 kHz
0.1 V rms ± 0.01 V open circuit for full scale
meter deflection; 0.05 V rms ± 0.005 V into 2 k Ω

for full scale meter deflection.

POWER SUPPLY

115 V or 230 V $\pm 10\%$, 48 to 440 Hz, approximately 4 watts. Terminals are provided for external battery supply. Positive and negative voltages between 28 V and 50 V are required. Current drain from each voltage is 40 mA.

MODEL 332A

Same as Model 331A except as indicated below:

AM DETECTOR

High impedance dc restoring peak detector with semi-conductor diode operates from 550 kHz to greater than 65 MHz. Broadband input. Maximum input; 40 V p-p ac or 40 V peak transient.

CARRIER FREQUENCY

550 kHz to 1.6 MHz: Distortion introduced by detector is <0.3% for 3 to 8 volt carriers modulated 30%.

1.6 MHz to 65 MHz: Distortion introduced by detector is <1% for 3 to 8 volts rms carriers modulated 30%.

NOTE

Distortion measurement at carrier levels as low as 1 volt may be made with reduced accuracy.

OPTION 01

Indicating meter has VU characteristics conforming to FCC Requirements for AM, FM, and TV broadcasting.

SECTION II

INSTALLATION

2-1. INSPECTION.

2-2. This instrument was carefully inspected both mechanically and electrically before shipment. It should be physically free of marks or scratches and in perfect electrical order upon receipt. To confirm this, the instrument should be inspected for physical damage in transit. Also check for supplied accessories, and test the electrical performance of the instrument using the procedure outlined in Section V. If there is damage or deficiency, see the warranty on the inside front cover of this manual.

2-3. POWER REQUIREMENTS.

2-4. The Model 331A and 332A will operate from either 115 or 230 Vac, 48 to 440 Hz. The instruments can be easily converted from 115 to 230 volt operation by changing the position of the slide switch, located on rear panel, so that the designation appearing on the switch matches the nominal voltage of the power source. A 1/16 ampere, slow-blow fuse is used for 115 V operation; a 1/32 ampere slow-blow fuse is used for 230 V operation. The instruments can be battery operated by connecting two 28 to 50 V batteries (rated at 40 milliamperes) to the battery terminals on the rear panel.

2-5. THREE-CONDUCTOR POWER CABLE.

2-6. To protect operating personnel, the National Electrical Manufacturers' Association (NEMA) recommends that the instrument panel and cabinet be grounded. This instrument is equipped with a three-conductor power cable which, when plugged into an appropriate receptacle, grounds the instrument. The offset pin on the power cable three-prong connector is the ground wire.

2-7. To preserve the protection feature when operating the instrument from a two-contact outlet, use a three-prong adapter and connect the green pigtail on the adapter to ground.

2-8. INSTALLATION.

2-9. The 331A and 332A are fully transistorized; therefore, no special cooling is required. However, the instruments should not be operated where the ambient temperature exceeds 55°C (131°F).

2-10. RACK/BENCH INSTALLATION.

2-11. The 331A and 332A are initially shipped as bench-type instruments (unless ordered specifically as a rack-type) with plastic feet and a tilt stand in place. Conversion to a rack-mounted instrument can be accomplished by using the rack mounting kit and instructions furnished with your instrument.

2-12. REPACKAGING FOR SHIPMENT.

2-13. The following is a general guide for repackaging for shipment. If you have any questions, contact your local -hp- Sales and Service Office.

NOTE

If the instrument is to be shipped to Hewlett-Packard for service or for repair, attach a tag to the instrument identifying the owner and indicating the service or repair to be accomplished; include the model number and full serial number of the instrument. In any correspondence, identify the instrument by model number and serial number.

- a. Place instrument in original container if available. If original container is not available, a suitable one can be purchased from your nearest -hp- Sales and Service Office.

If original container is not used,

- b. Wrap instrument in heavy paper or plastic before placing in an inner container.
- c. Use plenty of packing material around all sides of instrument and protect panel faces with cardboard strips.
- d. Place instrument and inner container in a heavy carton or wooden box and seal with strong tape or metal bands.
- e. Mark shipping container with "DELICATE INSTRUMENT," "FRAGILE" etc.

Figure 3-1. Front and Rear Panel Description

SECTION III

OPERATING INSTRUCTIONS

3-1. INTRODUCTION.

3-2. The Models 331A and 332A Distortion Analyzers measure total harmonic distortion of fundamental frequencies from 5 Hz to 600 kHz; harmonics up to 3 MHz are included. The sharp elimination characteristics (>80 dB), the low level of instrument induced distortion, and the meter accuracy of these instruments result in highly accurate measurement of low level harmonic distortion.

3-3. An rms calibrated voltmeter is inherent in the 331A and 332A. The voltmeter provides a full scale sensitivity of 300 μ volts rms (residual noise <25 μ volts). The voltmeter frequency range is from 5 Hz to 3 MHz except on the 0.0003 volt range, which is from 20 Hz to 500 kHz.

3-4. CONTROLS AND INDICATORS.

3-5. Figure 3-1 illustrates and describes the function of all front and rear panel controls, connectors, and indicators. The description of each component is keyed to the drawing included within the figure.

3-6. GENERAL OPERATING INFORMATION.

3-7. INPUT CONNECTIONS.

3-8. A signal source can be connected to the 331A and 332A through twisted pair leads or a shielded cable with banana plug connectors. Keep all test leads as short as possible to avoid extraneous pickup from stray ac fields. When measuring low-level signals, avoid ground loop currents by connecting only the 331A or 332A Distortion Analyzer directly to power-line ground through a NEMA (three-prong) connector. Connect all other instruments to the power source through a three-prong to two-prong adapter and leave the pigtail disconnected. Both the 331A and 332A have a dc isolation of ± 400 Vdc from the external chassis.

WARNING

WHEN THE INSTRUMENT IS OPERATED IN A FLOATING CONDITION, THE SET SCREWS IN THE CONTROL KNOBS WILL BE AT THE FLOATED POTENTIAL. TO PROTECT OPERATING PERSONNEL, ENSURE THAT THE SET SCREW HOLES ARE FILLED WITH AN INSULATING MATERIAL SUCH AS G. E. SILICON RUBBER, RTV-108. (-hp- PART NO. 0470-0304).

3-9. VOLTMETER CHARACTERISTICS.

3-10. The RMS VOLTS markings on the meter face are based on the ratio between the average and effective (rms) values of a pure sine wave. The ratio of average to effective values in a true sine wave is approximately 0.9 to 1. When the meter is used to measure complex waves, the voltage indicated may not be the rms value of the signal applied. This deviation of meter indication exists because the ratios of average to effective values are usually not the same in a complex wave as in a sine wave. The amount of deviation depends on the magnitude and phase relation between the harmonics and fundamental frequency of the signal applied. Table 3-1 shows the deviation of the meter indication of a sine wave partly distorted by harmonics. As indicated in the table, harmonic content of less than approximately 10% results in very small errors.

Table 3-1. Effect of Harmonics on Voltage Measurements

Input Voltage Characteristics	True RMS Value	Meter Indication
Fundamental = 100	100	100
Fundamental +10% 2nd harmonic	100.5	100
Fundamental +20% 2nd harmonic	102	100 - 102
Fundamental +50% 2nd harmonic	112	100 - 110
Fundamental +10% 3rd harmonic	100.5	96 - 104
Fundamental +20% 3rd harmonic	102	94 - 108
Fundamental +50% 3rd harmonic	112	90 - 116

NOTE

This chart is universal in application since these errors are inherent in all average-responding voltage-measuring instruments.

3-11. In distortion measurements where the fundamental frequency is suppressed and the remainder of the signal is measured, the reading obtained on an average-responding meter may deviate from the true total rms value. When the residual wave contains many inharmonically related sinusoids, the maximum error in the distortion reading is about 11% low for distortion levels below 10%.

Measured Distortion	Maximum Error in Meter Indication	Total Distortion
2.5%	$+0.11 \times 0.025 = 0.00027$	$0.025 + 0.0027 = 0.0277$ or 2.8%

This example represents the maximum possible error, and in most cases the error is less. In distortion measurements, the reading of an average-responding meter is sufficiently close to the rms value to be satisfactory for most applications.

3-12. OUTPUT CHARACTERISTICS.

3-13. The OUTPUT terminals provide a 0.1 V rms open circuit output for full scale meter deflection. These terminals can be used to monitor the output signal with an oscilloscope, a true rms voltmeter, or a wave analyzer. The combinations of the distortion meter and oscilloscope provides more significant information about the device under test than the expression of distortion magnitude alone. Information obtained from the oscilloscope pattern is specific and reveals the nature of the distortion that sometimes occurs at such low levels that it is difficult to detect in the presence of hum and noise. The impedance at the OUTPUT terminals is 2000 ohms; therefore, capacitive loads greater than 50 pF should be avoided to maintain the accuracy of meter readings.

3-14. OPERATING PROCEDURES.

3-15. INSTRUMENT TURN-ON.

- a. If line voltage is to be used, set 115-230 Vac switch to coincide with voltage. Turn LINE switch to ON position. Pilot lamp will glow, indicating application of primary power.
- b. If batteries are to be used, connect both a +28 to +50 V and -28 to -50 V battery (or other dc source) to + and - battery terminals, respectively. (The LINE switch and pilot lamp are not in the circuit when batteries are used; therefore, an external switch may be used to provide a convenient means for disconnecting the batteries). When a dc power source is used, check the -25 V power supply output (any violet lead). If the output is not -25 V ± 0.5 V, adjust the power supply according to the procedure in Paragraph 5-24.

3-16. ADJUSTMENT OF METER MECHANICAL ZERO.

3-17. The meter is properly zero-set when the pointer rests over the zero calibration mark and the instrument is in its normal operating environment and is turned off. Zero-set the meter as follows to obtain maximum accuracy and mechanical stability:

- a. Turn instrument on and allow it to operate for at least 20 minutes, to let meter movement reach normal operating temperature.
- b. Turn instrument off and allow 30 seconds for all capacitors to discharge.
- c. Rotate zero adjustment screw clockwise until pointer is left of zero and moving upscale.
- d. Continue rotating screw clockwise; stop when pointer is exactly at zero.
- e. When pointer is exactly over zero, rotate adjustment screw slightly counterclockwise to relieve tension on pointer suspension. If pointer moves off zero, repeat steps c through e, but make counterclockwise rotation less.

3-18. DISTORTION MEASUREMENT.

DO NOT EXCEED THE INPUT VOLTAGES LISTED BELOW TO PREVENT BLOWING FUSE F2: (See Table 5-8 for symptoms of blown-fuse.)

VOLTMETER FUNCTION -1 V RANGE AND BELOW, AND DISTORTION ANALYZER FUNCTION - MAXIMUM SENSITIVITY.

1. 300 V ABOVE 100 Hz
2. 50 V ABOVE 1 KHZ

IF LOW FREQUENCIES ARE NOT TO BE MEASURED, C1 MAY BE REPLACED WITH A SMALLER CAPACITOR, AND THE VOLTAGE LIMITS OF F2 MAY BE RAISED ACCORDINGLY.

- a. Turn instrument on and mechanically zero meter according to procedure in Paragraphs 3-15 and 3-16.
- b. Set NORM-R. F. DET. switch to NORM.
- c. Set FUNCTION switch to SET LEVEL.
- d. Set SENSITIVITY selector to MIN. position, and rotate VERNIER control maximum counter-clockwise.

NOTE

The bandwidth of the SENSITIVITY selector is reduced in the two extreme counterclockwise positions (positions used with an input signal greater than 30 V).

- e. Set METER RANGE switch to SET LEVEL, and set BALANCE COARSE and FINE controls to center position.
- f. Connect signal to be measured to 331A/332A INPUT terminals.

REMOVE SHORTING STRAP BETWEEN CIRCUIT GROUND ($\nearrow$) AND CHASSIS GROUND ($\perp$) TERMINALS ON FRONT PANEL INPUT TERMINAL WHEN MEASURING DISTORTION BETWEEN TWO POINTS WHICH ARE DC OFFSET FROM GROUND POTENTIAL.

- g. Set SENSITIVITY selector to obtain meter indication greater than 1/3 full scale.

- h. Adjust SENSITIVITY VERNIER for full scale meter indication if making distortion measurement in percent; if making distortion measurement in dB, adjust SENSITIVITY VERNIER for 0 dB meter indication.

————— NOTE —————

If unable to adjust for full scale or 0 dB indication (which indicates input signal is below 0.3 volts), set METER RANGE selector down-scale. Use this new setting as the 100% or 0 dB SET LEVEL position, thus making the next range 30% or -10 dB etc.

- i. Set FREQUENCY RANGE switch and frequency dial to fundamental frequency of input signal.
- j. Set FUNCTION switch to DISTORTION.
- k. Adjust frequency dial vernier and BALANCE COARSE and FINE controls for minimum meter indication. Set METER RANGE switch down-scale as necessary to keep meter indication on scale.

————— NOTE —————

Because of the high sensitivity and narrow fundamental rejection notch, pressure applied to the top cover may cause the null to shift. This is caused by small capacitive changes between the Wien bridge and case. Accuracy of reading is not degraded, however, if the pressure is constant and the bridge is rebalanced.

- l. Repeat step k until no further reduction in meter indication can be obtained.
- m. Observe distortion either in percentage or dB, as indicated by meter deflection and METER RANGE switch setting. For example, if meter indicates 0.4 and METER RANGE setting is 1%, distortion measured is 0.4% of fundamental. Similarly, if meter indicates -6 dB and METER RANGE setting is -40 dB, distortion measured is -46 dB from fundamental.

————— NOTE —————

The accuracy of distortion measurements is affected by the frequency stability of the input signal. An inaccuracy in distortion indications occurs when the frequency drift of the input signal exceeds the bandwidth of the rejection curve.

- p. If desired, rms voltage of input signal can be measured by setting FUNCTION switch to VOLTMETER, and setting METER RANGE switch to obtain an on-scale indication.

3-19. DISTORTION AND NOISE MEASUREMENT OF AM RF CARRIERS (332A ONLY).

DO NOT EXCEED MAXIMUM INPUT VOLTAGES LISTED ON REAR PANEL.

3-20. DISTORTION MEASUREMENT.

- Turn instrument on and mechanically zero meter according to procedure in Paragraphs 3-15 and 3-16.
- Set NORM. -R. F. DET. switch to R. F. DET.
- Connect input signal to R. F. INPUT terminal on rear panel.
- Refer to Paragraph 3-18 for distortion measurement procedures.

————— NOTE —————

If no meter deflection can be obtained with an RF input, diode A4CR1 should be checked. A spare diode is located on the outside of the A4 shield.

3-21. NOISE MEASUREMENT.

- Perform steps a through c of Paragraph 3-20.
- Set modulation of carrier to 100%, using a modulating frequency between 20 Hz and 20 kHz.
- Set FUNCTION switch to SET LEVEL, and set METER RANGE to SET LEVEL.
- Adjust SENSITIVITY controls for 0 dB indication on meter.
- Reduce modulation of carrier to 0%.
- Leave FUNCTION switch in SET LEVEL position, and adjust METER RANGE switch for on-scale meter indication.
- Noise level of carrier is algebraic sum of meter reading and METER RANGE setting.
- This same general procedure can be used to measure noise in an FM carrier when an external discriminator is substituted for the AM detector.

3-22. VOLTAGE MEASUREMENT.

- Turn instrument on and mechanically zero meter according to procedure in Paragraphs 3-15 and 3-16.
- Set NORM. -R. F. DET. switch to NORM.
- Set FUNCTION switch to VOLTMETER.
- Set METER RANGE switch to a range exceeding amplitude of signal to be measured.

- e. Connect signal to be measured to INPUT terminals.
- f. Set METER RANGE switch to give a reading as close to full scale as possible, and observe meter indication.
- g. The dB scale of the 331A/332A is calibrated in dBm, such that 0 dBm = 1 milliwatt dissipated by 600 ohms. Therefore, a dBm measurement must be made across 600 ohms. However, dB measurements across other impedances can be converted to dBm by use of the Impedance Correction Graph of Figure 3-2. For example: To convert a -30 dB reading across 200 ohms to dBm, locate the 200 ohm impedance line at the bottom of the graph. Follow the impedance line to the heavy black line, and read the meter correction at that point. The correction for 200 ohms is +5 dBm; thus the corrected reading is -25 dBm.

————— NOTE —————

When dBm measurements are made, the dB markings on the METER RANGE switch must each be lowered

by 10. That is, the dB marking for the 0.3 V range becomes -10 dBm, 1 V range becomes 0 dBm, 3 V range becomes +10 dBm etc. If the other dB markings are used, the dBm readings will be 10 dBm high.

3-23. USE OF OUTPUT TERMINALS.

3-24. In VOLTMETER and SET LEVEL functions, the 331A/332A can be used as a low distortion, wide-band amplifier. A portion of the meter input (0.1 V rms open circuit for full scale meter deflection) is provided at the OUTPUT terminals.

3-25. In DISTORTION function, the distortion (0.1 V rms open circuit for full scale deflection) is provided at the OUTPUT terminals for monitoring purposes.

3-26. 331A/332A WITH OPTION 01.

3-27. Operating procedures for the 331A/332A with Option 01 are the same as for the standard instrument. The only difference between the standard and optional instrument is that the Option 01 has a special meter and meter amplifier which is compensated to respond to VU (volume unit) characteristics.

Figure 4-1. Model 331A and 332A Block Diagram

SECTION IV

THEORY OF OPERATION

4-1. OVERALL DESCRIPTION.

4-2. Models 331A and 332A Distortion Analyzers include an impedance converter circuit, a rejection amplifier, a metering circuit, and a power supply circuit. In addition to these four circuits, the Model 332A contains an AM detector circuit. A block diagram of the instrument is shown in Figure 4-1. The impedance converter provides a low noise input circuit with a high source impedance independent of signal impedance placed at the input terminals. The rejection amplifier rejects the fundamental frequency of an input signal and passes the remaining frequency components on to the metering circuit for measuring distortion. The metering circuit provides visual indications of distortion and voltage levels on the front panel meter M1. The AM detector circuit (Model 332A only) detects the modulating signal from the RF carrier and filters any RF components from the modulating signal before it is applied to the impedance converter circuit.

4-3. BLOCK DIAGRAM DESCRIPTION.

(Refer to Figure 4-1.)

4-4. DISTORTION MEASURING OPERATION.

4-5. In the distortion measuring mode of operation, the input signal is applied to the impedance converter circuit (Assembly A2) through the FUNCTION selector, S1, and the one megohm attenuator. The attenuator is a voltage divider network which provides 50 dB attenuation in 10 dB steps. The desired level of attenuation is selected by the SENSITIVITY selector, S2. The impedance converter circuit provides an impedance conversion and unity gain between the instrument input terminals and the input of the rejection amplifier.

4-6. The rejection amplifier consists of a preamplifier, a Wien bridge, and a bridge amplifier circuit. The SENSITIVITY VERNIER control, at the input of the preamplifier circuit, provides a set level signal to obtain full scale readings on meter M1 for any input voltage level. With the FUNCTION selector in the SET LEVEL position, a ground is applied to the Wien bridge circuit to allow a signal reference level to be set up on the meter M1 in the metering circuit. With the FUNCTION selector in the DISTORTION position, the Wien bridge is used as an interstage coupling network between the preamplifier and bridge amplifier circuits. The Wien bridge is tuned and balanced to reject the fundamental frequency of the applied input signal. The remaining frequency components are passed on to the bridge amplifier circuit and are measured as distortion by the metering circuit. Negative feedback from the bridge amplifier to the preamplifier narrows the rejection response of the Wien bridge circuit.

4-7. The output of the rejection amplifier (1 dB gain) is applied to the metering circuit through the post-attenuator. The post-attenuator is used to limit the input signal level applied to the metering circuit to 1 mV for full scale deflection. The metering circuit sensitivity is increased to 300 μ V for full scale deflection on the 0.0003 V range. The metering circuit provides a visual indication of the distortion level in the input signal. In addition to the visual indication provided by the meter M1, the OUTPUT terminals provide a means of monitoring the distortion with an oscilloscope, a true rms voltmeter, or a wave analyzer.

4-8. DISTORTION MEASUREMENT IN AM CARRIERS.

4-9. The Model 332A Distortion Analyzer contains an AM detector circuit for measuring envelope distortion in AM carriers. The input signal is applied to the input of the AM detector circuit where the modulating signal is recovered from the RF carrier. The signal is then applied to the impedance converter circuit through the one megohm attenuator. The signal then goes through the same circuits previously described in the distortion measuring operation.

4-10. VOLTMETER OPERATION.

4-11. In the voltmeter mode of operation, the input signal is applied to the impedance converter circuit through the 1:1 and 1000:1 attenuator. The 1:1 attenuation ratio is used in the 0.0003 to 0.3 VOLTS positions of the METER RANGE switch S3, and the 1000:1 attenuation ratio is used in the 1 to 300 VOLTS positions. With the FUNCTION selector in the VOLTMETER position, the output of the impedance converter bypasses the rejection amplifier and is applied to the metering circuit through the post-attenuator and METER RANGE selector. In the voltmeter mode, metering circuit sensitivity is increased from 1 mV for full scale deflection to 300 μ V on the 0.0003 V range, the same as it was in the distortion mode of operation. The function of the post-attenuator and metering circuit is the same for the voltmeter mode as for the distortion mode.

4-12. DETAILED CIRCUIT DESCRIPTION.

4-13. IMPEDANCE CONVERTER CIRCUIT.

(Refer to Figure 7-1.)

4-14. The input signal to the distortion analyzer is applied to the impedance converter circuit through the 1:1 and 1000:1 attenuator, S3R12, in the voltmeter mode of operation and through the one megohm attenuator S2R1 through S2R6 in the distortion mode of operation. Capacitive dividers act in conjunction with the attenuators to keep the frequency response flat. The impedance converter is a low distortion, high input impedance amplifier with gain independent of the source impedance placed at the INPUT terminals.

4-15. Instrument induced distortion of the signal being measured is prevented by keeping the input impedance and the gain of the impedance converter linear. The input impedance is made linear by "boot strapping" the protection diodes A2CR2 and A2CR3 and the gate to drain capacitance of A2Q1 with local positive feedback. By keeping the input impedance linear, signals having a high source impedance can be measured accurately and the SENSITIVITY selector S2 can be used in the high impedance positions without distorting the input signal. In addition to having a high input impedance, the impedance converter serves as a linear amplifier. The open loop gain of the circuit is increased by "boot strapping" the collector load impedances of A2Q2 and A2Q3 with local positive feedback. Overall negative feedback from the emitter circuit of A2Q4 to the source of A2Q1 results in unity gain from the impedance converter circuit and keeps the distortion generated by the circuit well within the specifications listed in Table 1-1.

4-16. The bias points of the transistors in the impedance converter circuit have been selected for optimum distortion performance. The voltage at A2TP1 is set for optimum distortion performance for each individual instrument and should not be changed from the set value unless the field effect transistor A2Q1 is replaced. The field effect transistor used in the impedance converter provides extremely low noise performance independent of the signal source impedance, and aids in producing the high impedance input to the impedance converter circuit.

4-17. REJECTION AMPLIFIER CIRCUIT.

(Refer to Figure 7-2.)

4-18. The rejection amplifier circuit consists of the preamplifier, A3Q1 through A3Q3, the Wien bridge circuit, and the bridge amplifier, A3Q4 through A3Q6. A simplified block diagram of the rejection amplifier with the typical frequency rejection characteristic is shown in Figure 4-2.

4-19. PREAMPLIFIER CIRCUIT.

4-20. The signal from the impedance converter circuit is applied to the preamplifier circuit which is operational in the SET LEVEL and DISTORTION modes of operation. Negative feedback from the junction of A3R10 and A3R11 is applied to the junction of A3R2 and A3C2 to establish the operating point for A3Q1. Negative feedback from the emitter of A3Q3 is applied to the emitter of A3Q1 to stabilize the whole preamplifier circuit. The preamplifier circuit, like the impedance converter circuit, is designed for high open loop gain to insure maximum distortion performance.

4-21. WIEN BRIDGE CIRCUIT.

4-22. The Wien bridge circuit is used, in the distortion mode of operation, as a rejection filter for the fundamental frequency of the input signal. With the FUNCTION selector S1 in the DISTORTION position, the Wien bridge is connected as an interstage coupling network between the preamplifier circuit and the bridge amplifier circuit.

4-23. The bridge is tuned to the fundamental frequency of the input signal by varying the frequency tuning capacitors, C4A through C4D, after the FREQUENCY RANGE selector S4 is set for the applicable frequency range. The bridge circuit is brought into balance by adjusting the COARSE BALANCE control R4 and the FINE BALANCE control R5. When the bridge circuit is tuned and balanced, the voltage and phase of the fundamental, which appears at junction of the series reactive arm (S4R1-S4R10 and C4A/B) and the shunt reactive arm (S4R11-S4R20 and C4C/D), is the same as at the midpoint of the resistive branch (A3R12 and A3R14). When these two voltages are equal and are in phase, no output signal will appear at the drain of the field effect transistor A3Q4. For frequencies other than the fundamental, the reactive branch of the Wien bridge offers various degrees of attenuation and phase shift. The difference voltage between the reactive branch and resistive branch is amplified by A3Q4. Figure 4-3 illustrates a typical Wien bridge circuit and the rejection characteristic for this circuit. The

Figure 4-2. Rejection Amplifier Block Diagram and Typical Frequency Rejection Characteristic

Wien bridge circuit is designed to cover a continuous frequency range of 12 to 1 to insure an overlap of the coarse tuning range. Coarse tuning ranges are selected by the FREQUENCY RANGE selector S4 which changes the bridge circuit constants in five decade steps.

4-24. When the FUNCTION selector is set to the VOLT-METER or SET LEVEL position, the junction of the series and shunt reactive arm of the Wien bridge is connected to circuit ground through S1BF, which disables the frequency rejection characteristic of the bridge circuit. With the bridge circuit disabled, the rejection amplifier circuit provides one dB of gain for the fundamental frequency, the harmonics, and for the residuals to establish the set level reference in the SET LEVEL mode of operation.

4-25. BRIDGE AMPLIFIER CIRCUIT.

4-26. The bridge amplifier circuit consists of three stages of amplification, A3Q4 through A3Q6. The first stage of amplification, A3Q4, is a field effect transistor which amplifies the difference signal between the gate and the source. The field effect transistor is selected for maximum noise performance with the high impedances of the Wien bridge circuit. The signal from the drain is applied to the two stage feedback amplifier A3Q5 and A3Q6. The bias potential at A3TP2 is set for maximum distortion performance for each individual instrument and should not be changed from the set value unless the field effect transistor A3Q4 is replaced.

4-27. The output of A3Q6 is coupled to the meter circuit through the post attenuator S3R1 through S3R11. Negative feedback from the output of the bridge amplifier is applied to the preamplifier circuit to narrow the frequency rejection characteristic. It can be noted from the rejection characteristic (refer to Figure 4-3) for the bridge that the rejection of harmonic

voltages is not constant. Typically the second harmonic is attenuated several dB more than the third harmonic, and the third more than the fourth. The result of the negative feedback is illustrated by the rejection characteristic shown in dashed lines on the amplitude and phase characteristic of Figure 4-3. Refer to Figure 4-4, Bandwidth versus Null Depth for further detail on the rejection characteristic.

4-28. METER CIRCUIT.

(Refer to Figure 7-3.)

4-29. The meter circuit consists of the post attenuator, the meter amplifier circuit, and the meter rectifier circuit.

4-30. POST ATTENUATOR.

4-31. The post attenuator, S3R1 through S3R11, is a series of resistor networks which provide attenuation of input signals in 10 dB steps. The attenuator is used in conjunction with either the input sensitivity attenuator or the 1000:1 attenuator to limit the signal level to the meter amplifier to 1 mV for full scale deflection on all ranges from 1 mV to 300 V full scale. The meter circuit sensitivity is increased to $300 \mu\text{V}$ for full scale deflection on the 0.0003 V range by switching resistors A2R29 and A2R30 into the calibration network. Resistor A2R41 and capacitor A2C29 are also switched into the calibration network on the 0.0003 V range to extend the passband of the amplifier.

4-32. METER AMPLIFIER CIRCUIT.

4-33. The meter amplifier circuit consists of five stages of amplification, A2Q5 through A2Q9, which develop the current for full scale meter deflection. Negative dc feedback from the emitter circuit of A2Q8 is applied to the base of A2Q5 to stabilize the dc operating point of the meter amplifier circuit and to minimize

Figure 4-3. Wien Bridge Circuit and Rejection Characteristics

Figure 4-4. Bandwidth versus Null Depth

the tendency for dc drift due to ambient temperature changes. Negative ac feedback is applied from the collector circuit of A2Q9 to the emitter circuit of A2Q5. This feedback is used to insure a flat frequency response, to improve linearity, and to reduce the effect of variation of transistor parameters with environmental changes. In this manner, the calibration of the instrument is made dependent on high quality passive components.

4-34. METER RECTIFIER CIRCUIT.

4-35. The meter rectifier is connected in a bridge type of configuration with a diode in each upper arm and a dc milliammeter connected across the midpoints of the bridge. The simplified meter rectifier is illustrated in Figure 4-5. The generator represented by A2Q5 through A2Q9, with the internal impedance R_0 , provides the meter M1 with current for full scale deflection and develops a voltage across the calibration network which closes the ac feedback loop. Capacitors A2C27 and A2C28 are used as coupling capacitors for the ac feedback loop and the output signal to the OUTPUT connector. The mechanical inertia of the meter prevents the meter from responding to individual current pulses; therefore the meter pointer reading corresponds to the average value of the current pulses rather than the peak value. The meter calibration is to the rms value of a sine wave. Resistor A2R45 impresses a fixed bias across diodes A2CR6 and A2CR7 (biasing them close to the barrier voltage) to make the meter circuit response linear to large variations in signal amplitude. The linearity of this type of circuit is also increased by enclosing the meter circuit in the overall feedback loop.

4-36. POWER SUPPLY CIRCUIT.

(Refer to Figure 7-4.)

4-37. The power supply circuit consists of a +25 volt series regulated supply and a -25 volt series regulated supply which is the reference supply for the +25 volt supply.

4-38. The -25 volt regulated supply is of the conventional series regulator type. The amplifier A1Q5 is used to increase the loop gain of the circuit, thus improving voltage regulation. The positive feedback applied to the junction of A1R11 and A1R12 is used to further improve the line frequency suppression of the circuit.

4-39. The +25 volt regulated supply is of the conventional series regulator type and operates the same as the -25 volt regulated supply.

4-40. Diodes A1CR5 and A1CR6 are coupling and protection diodes for external battery supplies. The diodes protect the series regulator circuits from application of incorrect polarity at the battery input terminals. The diodes also protect external batteries from being charged in the wrong direction when the ac power is being used with batteries connected to the battery terminals.

4-41. RF DETECTOR CIRCUIT (332A ONLY).

(Refer to Figure 7-1.)

4-42. The RF detector circuit consists of a rectifier, A4CR1, and filter circuit. The RF signal is applied to the circuit through the RF INPUT connector on the rear panel. The rectifier diode A4CR1 recovers the modulating signal from the RF carrier and the filter circuit removes any RF components before the signal is applied to the impedance converter circuit through the NORM-RF DET switch S7.

SECTION V MAINTENANCE

5-1. INTRODUCTION.

5-2. This section contains maintenance and service information for the 331A and 332A Distortion Analyzers. Included are Performance Checks, Adjustment and Calibration Procedures and Troubleshooting Procedures.

5-3. REQUIRED TEST EQUIPMENT.

5-4. The equipment needed to properly maintain the Model 331A/332A is listed in Table 5-1. If the recommended model is not available, any instrument that has specifications equal to or better than the required specifications may be used.

5-5. PERFORMANCE CHECKS.

5-6. The performance checks are in-cabinet procedures that can be used to verify instrument performance. These procedures can be used for periodic maintenance, to check specifications after a repair, or for incoming quality control inspection. Performance checks for both the 331A and 332A are provided. The performance checks are applicable to both instruments except where noted in the paragraph heading. If the instrument fails to meet any of its specifications, perform the Adjustment and Calibration Procedures, Paragraph 5-21. The Performance Checks and Adjustment and Calibration Procedures should be performed at six month intervals to assure optimum operation of the instrument.

5-7. The performance checks are made with the ac power cord connected to nominal line voltage (115 V or 230 V, 48 to 440 Hz) and NORM. - R. F. DET. switch to NORM, unless otherwise specified.

5-8. A Performance Check Test Card is provided at the end of this section for recording the performance of the instrument during the performance checks. The card may be removed from the manual and used as a permanent record of the incoming inspection or of a routine performance check.

5-9. FUNDAMENTAL REJECTION CHECK.

- a. Connect test equipment to 331A/332A as shown in Figure 5-1. Set filter pass frequency to 500 Hz.

NOTE

The test oscillator output is filtered so that the input to the 331A/332A is a pure signal at the desired frequency.

- b. Set 331A/332A controls as follows:
 FUNCTION VOLTMETER
 METER RANGE 1 VOLT
 FREQUENCY RANGE . . . X100
 Frequency Dial 5
- c. Set test oscillator frequency to 500 Hz, and adjust amplitude for indication of 1.0 V on meter of 331A/332A.

Figure 5-1. Fundamental Rejection Check

- d. Set 331A/332A FUNCTION switch to SET LEVEL, and set METER RANGE to 0.3 V. Adjust SENSITIVITY controls for 0 dB indication on 331A/332A meter.
- e. Adjust wave analyzer controls for maximum reading (approximately 500 Hz), and use reading as 0 dB reference.
- f. Set 331A/332A FUNCTION switch to DISTORTION.
- g. Adjust 331A/332A frequency dial vernier and BALANCE controls for minimum meter indication. Reduce METER RANGE switch setting as necessary to maintain on-scale meter indication.
- h. Observe wave analyzer meter, and reduce wave analyzer range setting as necessary to maintain on-scale meter indication.

————— NOTE —————

The 331A/332A OUTPUT is a 0 to 0.1 V signal that is proportional to meter deflection, regardless of METER RANGE setting. Each decrease of the METER RANGE setting represents 10 dB fundamental rejection; therefore, the total fundamental rejection is the sum of the 331A/332A METER RANGE setting and the wave analyzer reading.

- i. The 331A/332A METER RANGE setting plus wave analyzer reading should total more than -80 dB.
- j. Repeat steps b thru i with 331A/332A and test equipment frequencies set to 5 kHz, 50 kHz, 250 kHz, and 600 kHz.

5-10. SECOND HARMONIC ACCURACY CHECK.

- a. Connect 50 Ω output of test oscillator, terminated in 50 Ω load, to 331A/332A.
- b. Set 331A/332A controls as follows:
 FUNCTION SET LEVEL
 METER RANGE SET LEVEL
 FREQUENCY RANGE . . . X1
 Frequency Dial 15

- c. Set test oscillator frequency to 15 Hz at an amplitude of 1 V.
- d. Adjust 331A/332A SENSITIVITY controls for 0 dB indication on meter.
- e. Set 331A/332A FUNCTION switch to DISTORTION. Adjust frequency dial vernier and BALANCE controls for best null indication on meter. Do not change frequency or balance settings after best null is obtained.
- f. Set 331A/332A FUNCTION and METER RANGE switches to SET LEVEL.
- g. Set test oscillator frequency to 30 Hz, and adjust amplitude for 0 dB indication on 331A/332A meter.
- h. Set 331A/332A FUNCTION switch to DISTORTION. Meter reading should not change more than +1 dB from 0 dB reference.
- i. Repeat steps b through h for each respective frequency and second harmonic listed in Table 5-2. 331A/332A meter readings should remain within tolerances listed in the table.

Table 5-2. Second Harmonic Accuracy Check

331A/332A FREQUENCY	TEST OSCILLATOR FREQUENCY (Second Harmonic)	331A/332A TOLERANCES
10 kHz	20 kHz	< $\pm$ 0.6 dB
50 kHz	100 kHz	<-1.0 dB
200 kHz	400 kHz	<-2.0 dB
500 kHz	1 MHz	<-3.0 dB

5-11. INSTRUMENT INDUCED DISTORTION CHECK.

- a. Connect test equipment to 331A/332A as shown in Figure 5-2. Set filter pass frequency to 500 Hz.
- b. Set 331A/332A controls as follows:
 FUNCTION SET LEVEL
 SENSITIVITY MAX.
 SENSITIVITY VERNIER . . . MIN.
 METER RANGE SET LEVEL
 FREQUENCY RANGE . . . X100
 Frequency Dial 5

Figure 5-2. Instrument Induced Distortion Check

- c. Set test oscillator frequency to 500 Hz, and adjust amplitude for indication of +2 dB on 331A/332A meter.
- d. Set 331A/332A FUNCTION switch to DISTORTION.
- e. Adjust 331A/332A frequency dial vernier and BALANCE controls for minimum meter indication. Reduce METER RANGE setting as necessary to maintain on-scale meter indication.
- f. 331A/332A meter indication should be at least 70 dB below +2 dB reference.
- g. Repeat steps b through f with 331A/332A and test equipment frequencies set to 250 kHz and 600 kHz. 331A/332A meter indication should be at least 64 dB below +2 dB reference.
- e. **DO NOT** adjust 331A/332A frequency controls. Adjust test oscillator frequency and 331A/332A BALANCE controls for minimum indication on 331A/332A meter.
- f. Repeat step e until best null is indicated on 331A/332A. Reduce METER RANGE setting as necessary to maintain on-scale meter indication.
- g. Electronic counter should indicate period of 100 msec $\pm$ 5 msec (10 Hz $\pm$ 5%).
- h. Set electronic counter to read frequency. Repeat steps b through f for each frequency listed in Table 5-3. At each respective frequency setting, electronic counter should indicate that test oscillator frequency is within tolerances listed in table.

5-12. FREQUENCY CALIBRATION ACCURACY CHECK.

- a. Connect test equipment to 331A/332A as shown in Figure 5-3. Set electronic counter to read period.

NOTE

In this check, the 331A/332A frequency dial is held constant and the input frequency is varied and monitored. If the dial is low, the input frequency will be high at null and vice versa.

- b. Set 331A/332A controls as follows:
 FUNCTION SET LEVEL
 SENSITIVITY MAX.
 METER RANGE SET LEVEL
 FREQUENCY RANGE X1
 Frequency Dial 10
- c. Set test oscillator frequency to 10 Hz, and adjust amplitude for indication of +2 dB on 331A/332A meter.
- d. Set 331A/332A FUNCTION switch to DISTORTION.

Table 5-3. Frequency Calibration Accuracy Check

331A/332A FREQUENCY	TEST OSCILLATOR FREQUENCY	ELECTRONIC COUNTER INDICATION
1 kHz	1 kHz	950 Hz to 1050 Hz
100 kHz	100 kHz	95 kHz to 105 kHz
200 kHz	200 kHz	190 kHz to 210 kHz
400 kHz	400 kHz	360 kHz to 440 kHz
600 kHz	600 kHz	540 kHz to 660 kHz

5-13. INPUT IMPEDANCE CHECK.

5-14. RESISTANCE CHECK.

- a. Connect 50 Ω output of test oscillator, terminated in 50 Ω load, to 331A/332A INPUT terminals.
- b. Set 331A/332A controls as follows:
 FUNCTION VOLTMETER
 SENSITIVITY MAX.
 SENSITIVITY VERNIER MAX.
 METER RANGE 1 VOLT
- c. Set test oscillator frequency to 100 Hz, and adjust amplitude for indication of 1 V on 331A/332A meter.

Figure 5-3. Frequency Calibration Accuracy Check

- d. Connect a 100 k Ω resistor in series with 331A/332A input.
- e. 331A/332A meter should indicate between 0.9 V and 0.92 V. This verifies an input resistance of 1 M Ω $\pm$ 5% in voltmeter function.
- f. Remove 100 k Ω resistor, and reconnect oscillator to 331A/332A.
- g. Set 331A/332A FUNCTION switch to SET LEVEL, and set METER RANGE switch to 0.1 VOLT.
- h. Adjust test oscillator amplitude for 331A/332A meter indication of 0.1 V.
- i. Connect 100 k Ω resistor in series with 331A/332A input.
- j. 331A/332A meter should indicate between 0.090 V and 0.092 V. This verifies an input resistance of 1 M Ω $\pm$ 5% in set level and distortion functions.
- f. Set test oscillator to 100 Hz and adjust amplitude for 331A/332A meter indication of 0.1 V. Set a reference on meter of test oscillator and use amplitude controls to maintain set reference whenever frequency of oscillator is changed.
- g. Increase frequency of test oscillator to 230 kHz. 331A/332A meter should indicate 70.7 mV or greater, verifying an input capacitance of 70 pF or less on 0.1 V range in voltmeter function.
- h. Set 331A/332A FUNCTION switch to SET LEVEL.
- i. Set test oscillator to 100 Hz, and adjust amplitude for 331A/332A meter indication of 0.1 V. Set a reference on meter of test oscillator and use amplitude control to maintain set reference whenever frequency of oscillator is varied.
- j. Increase frequency of test oscillator to 230 kHz. 331A/332A meter should indicate 70.7 mV or greater, verifying an input capacitance of 70 pF or less in set level and distortion functions.

5-15. CAPACITANCE CHECK.

- a. Connect 50 Ω output of test oscillator, terminated in 50 Ω load, and 10 k Ω resistor to 331A/332A as shown in Figure 5-4. Connect resistor lead to INPUT terminal of 331A/332A, and insert other lead directly into 50 Ω load. Connect ground lead from 331A/332A to outer shield of 50 Ω load; do not use an adapter, as it would add capacitance.
- b. Set 331A/332A controls as follows:
 FUNCTION VOLTMETER
 SENSITIVITY MAX.
 SENSITIVITY VERNIER . MAX.
 METER RANGE 1 VOLT
- c. Set test oscillator to 100 Hz and adjust amplitude for 331A/332A meter indication of 1 V. Set a reference on meter of test oscillator and use amplitude control to maintain set reference whenever frequency of oscillator is changed.
- d. Increase frequency of test oscillator to 540 (455) kHz. 331A (332A) meter should indicate 0.707 V or greater, verifying an input capacitance of 30 pF (35 pF) or less on 1 V range in voltmeter function.
- e. Set 331A/332A METER RANGE switch to 0.1 V range.

5-16. MINIMUM INPUT LEVEL CHECK.

- a. Connect 50 Ω output of test oscillator, terminated in 50 Ω load, to 331A/332A INPUT terminals.
- b. Set 331A/332A controls as follows:
 FUNCTION VOLTMETER
 SENSITIVITY MAX.
 SENSITIVITY VERNIER . MAX.
 METER RANGE 0.3 VOLTS
- c. Set test oscillator to 400 Hz and adjust amplitude for 331A/332A meter indication of 0.3 V.
- d. Set 331A/332A FUNCTION switch to SET LEVEL.
- e. 331A/332A meter should indicate full scale or greater.

5-17. DC ISOLATION CHECK.

- a. Connect test equipment to 331A/332A as shown in Figure 5-5.

Figure 5-4. Capacitance Check

WARNING

REMOVE SHORTING BAR BETWEEN CHASSIS GROUND ($\perp$) AND CIRCUIT GROUND (∇) ON 331A/332A INPUT TERMINALS.

- b. Set 331A/332A controls as follows:
 FUNCTION VOLTMETER
 METER RANGE 1 VOLT
- c. Set oscillator to 1 kHz, and adjust amplitude for 331A/332A meter indication of 0.9 V.
- d. Set power supply to ± 400 Vdc. 331A/332A meter indication should not change, and ammeter of power supply should indicate that no current is flowing.

5-18. VOLTMETER ACCURACY AND FREQUENCY RESPONSE CHECK.

- a. Connect voltmeter calibrator to 331A/332A as shown in Figure 5-6. Test oscillator will be used later in check.
- b. Set 331A/332A FUNCTION switch to VOLT-METER.
- c. Set voltmeter calibrator for 400 Hz rms output.
- d. Check 331A/332A voltmeter full scale reading on all ranges against appropriate rms input from voltmeter calibrator. Voltmeter accuracy should be within $\pm 2\%$.
- e. Disconnect voltmeter calibrator and connect 50 Ω output of test oscillator, terminated in 50 Ω load, to 331A/332A.

- f. Set 331A/332A METER RANGE switch to 3 VOLTS. *from STEP D on*
- g. Set test oscillator to 400 Hz, and adjust for 331A/332A meter indication of 3.0 V. Set reference on meter of test oscillator and use amplitude control to maintain set reference whenever frequency of oscillator is varied.
- h. Set test oscillator to each frequency listed in Table 5-4. At each respective frequency, 331A/332A meter indication should be within tolerances listed in table.
- i. Set 331A/332A METER RANGE switch to 0.0003 VOLTS.
- j. Set test oscillator to 400 Hz and adjust amplitude for 331A/332A meter indication of 300 μ V. Set reference on meter of test oscillator and use amplitude control to maintain set reference whenever frequency of oscillator is varied.
- k. Set test oscillator to each frequency listed in Table 5-4. At each respective frequency, 331A/332A meter reading should be within tolerances listed in table.

Table 5-4. Voltmeter Frequency Response Check

FREQ.	3 V RANGE METER INDICATION		FREQ.	0.0003 V RANGE METER INDICATION	
	MIN.	MAX.		MIN.	MAX.
10 Hz	2.94 V	3.06 V	20 Hz	285 μ V	315 μ V
1 kHz	2.94 V	3.06 V	30 Hz	294 μ V	306 μ V
10 kHz	2.94 V	3.06 V	1 kHz	294 μ V	306 μ V
100 kHz	2.94 V	3.06 V	10 kHz	294 μ V	306 μ V
1 MHz	2.94 V	3.06 V	100 kHz	294 μ V	306 μ V
2 MHz	2.85 V	3.15 V	300 kHz	294 μ V	306 μ V
3 MHz	2.85 V	3.15 V	500 kHz	285 μ V	315 μ V

Figure 5-5. DC Isolation Check

Figure 5-6. Voltmeter Accuracy and Frequency Response Check

5-19. RESIDUAL NOISE CHECK.

- Connect a shielded 600 Ω load across 331A/332A INPUT terminals. (See Figure 5-7 for details on constructing shielded load.) Be sure that shorting bar is connected between chassis ground and circuit ground on INPUT terminals.
- Set 331A/332A controls as follows:
 FUNCTION VOLTMETER
 METER RANGE 0.0003 VOLTS
- Meter should indicate less than 25 μ V.
- Remove 600 Ω load. Connect a shielded 100 k Ω load across INPUT terminals. (See Figure 5-7 for details on constructing shielded load.)
- Meter should indicate less than 30 μ V.

5-20. AM DETECTOR CHECK (MODEL 332A ONLY).

- Connect high frequency signal generator 50 Ω RF output to 332A R. F. INPUT terminal.
- Set 332A controls as follows:
 FUNCTION SET LEVEL
 NORM. - R. F. DET. . . . R. F. DET.
 METER RANGE SET LEVEL
 FREQUENCY RANGE X100
 Frequency Dial 10
- Set high frequency signal generator to 1 MHz at an amplitude of 3 V. Modulate high frequency signal generator output 30% at 1 kHz, using a test oscillator.
- Adjust 332A SENSITIVITY controls for 0 dB meter indication.
- Set 332A FUNCTION switch to DISTORTION.

Figure 5-7. Shielded Load Assembly

- f. Adjust 332A frequency dial vernier and BALANCE controls for minimum meter indication.
- g. Distortion should be more than 40 dB below 0 dB reference.

5-21. ADJUSTMENT AND CALIBRATION PROCEDURE.

5-22. The following is a complete adjustment and calibration procedure for the 331A and 332A. Before proceeding with these adjustments, the Performance Checks should be performed to determine whether adjustments are necessary. If your instrument does not meet the test limits specified in the following steps, refer to Troubleshooting Procedure, Paragraph 5-32 for possible cause and corrective action. Adjustment locations are shown in Figure 5-8.

5-23. The Adjustment and Calibration Procedure is performed with the ac power cord connected to nominal line voltage (115 V or 230 V, 48 to 440 Hz), unless otherwise specified.

5-24. POWER SUPPLY AND BIAS ADJUSTMENTS.

- a. Remove top and bottom covers from instrument.
- b. Be sure that shorting bar is connected between chassis ground and circuit ground INPUT terminals.
- c. Connect common lead of a dc voltmeter to either INPUT ground terminal.
- d. Perform the measurements and adjustments listed in Table 5-5.

CAUTION

DONOT ALLOW PROBE TO SHORT A2TP1 TO GROUND. IF THIS HAPPENS, A2Q4 MAY BE DESTROYED.

5-25. VOLTMETER GAIN ADJUSTMENTS.

- a. Connect voltmeter calibrator to 331A/332A as shown in Figure 5-6.
- b. Set 331A/332A controls as follows:
FUNCTION VOLTMETER
METER RANGE 0.001 VOLTS

- c. Set voltmeter calibrator to 1 mV rms output at 400 Hz.
- d. Adjust A2R34 (400 Hz CAL.) for a meter indication of 1.0 mV.
- e. Set voltmeter calibrator to 0.3 mV rms at 400 Hz. Set 331A/332A METER RANGE to 0.0003 VOLTS.
- f. Meter should indicate $300 \mu\text{V} \pm 6 \mu\text{V} (\pm 2\%)$. If necessary, change value of A2R30* to set reading within limits. Increasing resistance decreases meter reading, and vice versa. Typical values for this resistor are from 150 Ω to 300 Ω .

5-26. VOLTMETER FREQUENCY RESPONSE ADJUSTMENT.

- a. Connect test oscillator to 331A/332A as shown in Figure 5-6.

NOTE

Cover plate (Item 36 in Figure 6-1) must be in place while performing these adjustments.

- b. Set 331A/332A controls as follows:
FUNCTION VOLTMETER
METER RANGE 0.0003 VOLTS
- c. Set test oscillator to 400 Hz, and adjust amplitude for 331A/332A meter indication of 300 μV . Set a reference on meter of test oscillator and use amplitude control to maintain set reference whenever frequency of oscillator is changed.
- d. Set test oscillator frequency to 20 Hz.
- e. 331A/332A meter should indicate $300 \mu\text{V} \pm 15 \mu\text{V} (\pm 5\%)$. If reading exceeds these limits, change value of A2C30*. Typical values for this capacitor are between 10 μF and 50 μF .
- f. Set 331A/332A METER RANGE switch to 0.01 VOLTS.
- g. Set test oscillator to 400 Hz, and adjust amplitude for 331A/332A meter indication of 0.01 V. Set a reference on meter of test oscillator and use amplitude control to maintain set reference whenever frequency of oscillator is changed.

Table 5-5. Power Supply and Bias Adjustments

MEASUREMENT POINT	VOLTAGE LIMITS	ADJUSTMENT	REGULATION (vary line voltage between 103.5 and 127.5 VAC)
Any violet wire	-25 V ± 0.5 V	A1R13	-25 V ± 0.25 V
Any red wire	+25 V ± 1.0 V	None*	+25 V ± 1.0 V
A2 TP1	-11.3 V	A2R3	-11.3 V ± 0.1 V
A2 TP2	+ 8.2 V ± 0.5 V	A2R20	+ 8.2 V ± 0.5 V
A3 TP1	+ 2.65 V ± 0.2 V	A3R4	+ 2.65 V ± 0.2 V
A3 TP2	-20.2 V ± 0.3 V	A3R16	-20.2 V ± 0.3 V

* Referenced to -25 volt supply; -25 volt supply must be adjusted first.

Figure 5-8. Adjustment and Chassis Mounted Component Location

- h. Set test oscillator frequency to 2 MHz.
- i. Adjust A2R39 for 331A/332A meter indication of 0.01 V.
- j. Set test oscillator frequency to 3 MHz.
- k. Adjust A2C21 for 331A/332A meter indication of 0.01 V.

————— NOTE —————

Adjustments of A2R39 and A2C21 interact. Therefore, it may be necessary to repeat the two adjustments to bring both within tolerance.

- l. Set 331A/332A METER RANGE switch to 0.3 VOLTS.
- m. Set test oscillator to 400 Hz, and adjust amplitude for 331A/332A meter indication of 0.3 V. Set a reference on meter of test oscillator and use amplitude control to maintain set reference whenever frequency of oscillator is changed.
- n. Set test oscillator frequency to 2.5 MHz.
- o. Adjust S3C6 for 331A/332A meter indication of 0.3 V.
- p. Set 331A/332A METER RANGE switch to 3 VOLTS.
- q. Set test oscillator to 400 Hz, and adjust amplitude for 331A/332A meter indication of 3.0 V. Set a reference on meter of test oscillator and use amplitude control to maintain set reference whenever frequency of oscillator is changed.
- r. Set test oscillator frequency to 200 kHz.
- s. Adjust S3C1 for 331A/332A meter indication of 3.0 V.

5-27. SENSITIVITY SWITCH CALIBRATION.

- a. Connect test oscillator to 331A/332A as shown in Figure 5-6.

————— NOTE —————

Selector positions for the SENSITIVITY selector will be referred to as follows: MIN. = Position 1, next step = Position 2, etc. to MAX. = Position 6.

- b. Set 331A/332A controls as follows:
 FUNCTION SET LEVEL
 SENSITIVITY Position 5
 SENSITIVITY VERNIER . . . MAX.
 METER RANGE 0.01 VOLTS
- c. Set test oscillator to 400 Hz, and adjust amplitude for indication of 9 mV on 331A/332A meter. Set a reference on meter of test oscillator and use amplitude control to maintain set reference whenever frequency of oscillator is changed.
- d. Set test oscillator frequency to 100 kHz.
- e. Adjust S2C5 for 331A/332A meter indication of 9 mV.

- f. Set 331A/332A SENSITIVITY switch to each position listed in Table 5-6, and increase test oscillator output by 10 dB for each respective decrease in SENSITIVITY switch position. Adjust appropriate capacitor for 331A/332A meter indication of 9 mV at each setting.

————— NOTE —————

When switching the SENSITIVITY positions, be careful not to move the SENSITIVITY VERNIER control from MAX. position.

Table 5-6. Sensitivity Switch Calibration

SENSITIVITY Switch	TEST OSCILLATOR OUTPUT (Increase)	ADJUST FOR 9 mV
Position 4	+10 dB	S2C4
Position 3	+20 dB	S2C3
Position 2	+30 dB	S2C2
Position 1	+40 dB	S2C1

5-28. BRIDGE BALANCE ADJUSTMENT.

MAINTAIN THE LEAD DRESS TO C3 AND THE TUNING CAPACITOR, C4. ANY CHANGE IN LEAD DRESS WILL CAUSE A CHANGE IN CAPACITANCE.

- a. Connect test equipment to 331A/332A as shown in Figure 5-3.
- b. Set 331A/332A controls as follows:
 FUNCTION SET LEVEL
 SENSITIVITY 1 step counter-clockwise
 SENSITIVITY VERNIER . . . MIN.
 METER RANGE SET LEVEL
 FREQUENCY RANGE . . . X1K
 Frequency Dial 60
- c. Turn slot on trimmer capacitor C3 parallel with side casting of instrument.
- d. Set test oscillator to 60 kHz, and adjust amplitude for indication of +2 dB on 331A/332A meter.
- e. Set 331A/332A COARSE and FINE BALANCE controls to center of range.
- f. Set 331A/332A FUNCTION switch to DISTORTION.
- g. With a tuning wand, adjust C3 and test oscillator frequency vernier control for definite null indication on meter of 331A/332A. Reduce METER RANGE setting as necessary to maintain on-scale reading.
- h. Observe electronic counter indication. If test oscillator frequency is not between 57 kHz and 63 kHz, 331A/332A frequency dial is out of tolerance. Follow steps below to bring frequency dial within tolerance:

- 1) Set 331A/332A controls as in step b. Set test oscillator frequency for electronic counter indication of 60.00 kHz, and adjust amplitude for indication of +2 dB on meter of 331A/332A.
- 2) Set 331A/332A COARSE and FINE BALANCE controls to center of range.
- 3) Adjust 331A/332A frequency dial vernier for definite null.
- 4) Remove knob from frequency dial. Do not change tuning capacitor, C4, setting.
- 5) Loosen retaining screws in frequency dial plate, and slip dial until 60 is directly under mark on indicator. Be careful not to change C4 setting.
- 6) Tighten retaining screws and replace knob.
- c. Set test oscillator to 5 kHz, and adjust amplitude for +2 dB indication on 331A/332A.
- d. Set 331A/332A FUNCTION to DISTORTION. Adjust 331A/332A frequency dial vernier and BALANCE controls for definite null on the most sensitive range.
- e. Turn A3R30 fully counterclockwise. Turn A3R30 clockwise until 331A/332A meter indicates minimum distortion. Continue turning A3R30 clockwise until meter indication is 1 minor division (on 0 to 1 scale) above minimum distortion reading.

5-30. ADJUSTMENT OF FACTORY SELECTED COMPONENTS.

5-29. DISTORTION ADJUSTMENT.

- a. Connect test equipment to 331A/332A as shown in Figure 5-2. Set filter pass frequency to 5 kHz.
- b. Set 331A/332A controls as follows:

FUNCTION SET LEVEL
 SENSITIVITY MAX
 SENSITIVITY VERNIER MAX
 METER RANGE SET LEVEL
 FREQUENCY RANGE X100
 Frequency Dial 5

5-31. Certain components in the Model 331A/332A are individually selected to compensate for varying circuit parameters. These components are designated by an asterisk (*) on the schematic and parts list, and the typical value is shown. Table 5-7 describes the function of the factory selected components and lists their value ranges.

5-32. TROUBLESHOOTING PROCEDURES.

5-33. This section contains procedures designed to help locate malfunctions. These procedures are based on a systematic analysis of the instrument circuits in an effort to localize the problem. These operations should be performed only if the malfunction cannot be eliminated by the Adjustment and Calibration Procedures.

Table 5-7. Factory Selected Components

COMPONENT	FUNCTION	VALUE		
		Low	Normal	High
A2C22*	Sets range of A3C21.	0 pF	47 pF	47 pF
A2C23*	Adjusts meter frequency response in 2 MHz region.	100 pF	240 pF	320 pF
A2C30*	Adjusts meter frequency response in 20 Hz region.	10 μ F	22 μ F	50 μ F
A2C29*	Adjusts meter flatness on 0.0003 V range at 300 kHz.	0 pF	390 pF	680 pF
A2R30*	Adjusts meter amplifier gain on 0.0003 V range at 400 Hz.	150 Ω	300 Ω	300 Ω
A3C11*	Adjusts bridge amplifier frequency response on 1 MHz to 3 MHz region.	56 pF	127 pF	127 pF
A3R17*	Adjusts gain of rejection amplifier.	1 k Ω	2 k Ω	3 k Ω
C9*	Adjusts tracking of frequency dial.	0 pF	2.2 pF	6.8 pF
R3*	Adjusts range of S2R8.	0 Ω	390 Ω	390 Ω
S3C4*	Adjusts frequency response at 3 MHz	39 pF	47 pF	57 pF
S3R14*	Adjusts flatness of 1000:1 attenuator in 2 MHz to 3 MHz region.	7.5 Ω	10 Ω	10 Ω
S4R6* thru S4R26*	Must be individually matched to be $\pm 1/4\%$.	---	---	---

Table 5-8. Troubleshooting Aid

SYMPTOM	PROBABLE CAUSE
1. FRONT PANEL SYMPTOMS	
A. No meter deflection with signal at input; ON lamp not illuminated. (All FUNCTIONS)	Check Fuse (F1).
B. No meter deflection with signal at input (0.3 VOLT range); No output; ON lamp illuminated. (All FUNCTIONS)	Check Fuse (F2). Spare fuse located next to F2.
C. No meter deflection with signal at input; Output normal. (All FUNCTIONS)	Check M1.
D. No SENSITIVITY VERNIER control in SET LEVEL mode.	Check R2, R3, and S2R8.
E. BALANCE controls erratic. (DISTORTION FUNCTION only)	Check R4 and R5.
F. No meter deflection with RF input. (R. F. DET. only)	Check diode A4CR1. Spare diode located on outside of A4 shield.
2. INTERNAL ADJUSTMENT SYMPTOMS	
A. Insufficient -25 volts adjustment with A1R13, measured at any violet wire.	Check A1C1, A1C11, A1CR3, A1CR4, A1CR7 and A1Q4 through A1Q6.
B. +25 volts supply out of specs, measured at any red wire.	Check -25 volts (see Symptom 2-A above), A1C2, A1C6, A1CR1, A1CR2 and A1Q1 through A1Q3.
C. Insufficient bias adjustment with A2R3, measured at A2TP1.	Check -25 volts (see Symptom 2-A above), A2C4, A2C14 and A2Q1 through A2Q4.
D. Insufficient bias adjustment with A2R20, measured at A2TP2.	Check -25 volts (see Symptom 2-A above), +25 volts (see Symptom 2-B above), A2C15, A2Q5 through A2Q9.
E. Insufficient 400 Hz adjustment with A2R34.	Check +8.2 volts bias (see Symptom 2-D above), check for -3.2 Vdc at + meter terminal and Check M1.
F. Insufficient gain adjustment with A2R39.	Check A2Q5 through A2Q9, and A2C23.
G. Insufficient 3 MHz calibration adjustment with A2C21.	Check A2C22* (Increasing value of capacitor will decrease meter reading.)
H. Insufficient bias adjustment with A3R4, measured at A3TP1.	Check -25 volts (see Symptom 2-A above), +25 volts (see Symptom 2-B above), A3C1, A3C6 and A3Q1 through A3Q3.
J. Insufficient bias adjustment with A3R16, measured at A3TP2.	Check -25 volts (see Symptom 2-A above), A3C7, and A3Q4 through A3Q6. Change A3R17* (Increasing value of resistor will increase voltage at A3TP2.)

5-34. Conduct a visual check of the 331A/332A for possible burned or loose components, loose connections, or any other condition that might suggest a source of trouble. An investigation should also be made to insure that the trouble is not the result of conditions external to the 331A/332A.

THE 331A/332A CONTAINS VERY HIGH IMPEDANCE, HIGH FREQUENCY CIRCUITS. CONTAMINATION OF THE SWITCHES, CIRCUIT BOARDS, OR TUNING CAPACITOR WILL CAUSE HIGH IMPEDANCE LEAKAGE PATHS AND SUBSEQUENT DETERIORATION OF THE PERFORMANCE OF THE INSTRUMENT. AVOID TOUCHING ANY OF THESE CIRCUITS WITH THE BARE FINGERS, AS SKIN OILS ARE EXTREMELY CONTAMINATING. IF HANDLING IS NECESSARY, WEAR CLEAN COTTON OR RUBBER GLOVES.

5-35. Table 5-8 contains a list of typical front panel and internal trouble symptoms, as well as the probable cause of trouble. If the instrument malfunction cannot be located through use of the table, refer to Paragraphs 5-36 thru 5-39. Trouble in the Model 331A/332A can generally be isolated to circuits of one of the two principle functions - voltmeter or distortion. In order for the distortion function to operate properly, the voltmeter function must operate properly. Therefore, troubleshoot the voltmeter function first to assure that it works normally before attempting to locate a trouble in the distortion function.

5-36. TROUBLESHOOTING VOLTMETER FUNCTION.

5-37. Follow the steps below to troubleshoot the voltmeter function:

- a. Set 331A/332A controls as follows:
 FUNCTION VOLTMETER
 METER RANGE 1 VOLT
 Connect a 1 V rms, 1 kHz signal to 331A/332A INPUT terminals.
- b. Measure ac output of impedance converter at A2 Pin 4 for approximately 1 mV rms. (Use a 10 M Ω /10 pF impedance probe.) If proper signal is present, proceed to step c; if not, proceed to step d.
- c. Measure ac input to meter amplifier at A2 Pin 6 for approximately 1 mV rms. If proper signal is present, check meter circuit. (See schematic diagram of Figure 7-3 for ac and dc voltage levels in meter circuit.) If proper signal is not present, check post attenuator.
- d. Measure ac input to impedance converter at A2 Pin 1 for approximately 1 mV rms. If

proper signal is present, check impedance converter and power supply. (See appropriate schematic diagrams for voltage levels in impedance converter and power supply.) If proper signal is not present, check input attenuator and FUNCTION switch.

5-38. TROUBLESHOOTING DISTORTION FUNCTION.

5-39. Follow the steps below to troubleshoot the distortion function:

- a. Set 331A/332A controls as follows:
 FUNCTION VOLTMETER
 METER RANGE 0.3 VOLTS
 SENSITIVITY MAX.
 SENSITIVITY VERNIER MAX.
 FREQUENCY RANGE X1K
 Frequency Dial 5
 Connect a 1 kHz signal to 331A/332A INPUT, and adjust amplitude for 0 dB indication on 331A/332A meter.
- b. Set 331A/332A FUNCTION switch to SET LEVEL. 331A/332A meter should indicate between +0.5 dB and +1 dB, verifying gain in rejection amplifier. If sufficient gain is present, check Wien bridge circuit. If sufficient gain is not present, go to step c.
- c. Set amplitude of 1 kHz input signal to 0.3 V rms. Measure ac signal at A3 Pin 7 for approximately 180 mV rms (use a 10 M Ω /10 pF impedance probe). This voltage will increase to approximately 2.4 V rms in distortion function at null. If proper voltage is present, proceed to step d; if not go to step f.
- d. Measure ac output of rejection amplifier at A3 Pin 2 for approximately 0.32 V rms. If proper voltage is present, check function and meter range switch connections. If proper voltage is not present, go to step e.
- e. Measure ac signal at A3 Pin 8 for approximately 310 mV rms (use a 10 M Ω /10 pF impedance probe and be sure that Wien bridge is detuned with 1 kHz input and 331A/332A frequency at 5 kHz). If proper voltage is present, check A3Q4 through A3Q6 and associated circuitry. If proper voltage is not present, check Wien bridge circuit.
- f. Measure ac input to rejection amplifier at A3 Pin 1 for approximately 280 mV rms. If proper voltage is present, check A3Q1 through A3Q3 and associated circuitry. If proper voltage is not present, check sensitivity vernier and check FUNCTION switch connections.

5-40. SERVICING ETCHED CIRCUIT BOARDS.

5-41. The Model 331A has three etched circuit boards and the Model 332A has four. Use caution when removing them to avoid damaging mounted components.

The -hp- part number for the assembly is marked on the circuit board to identify it. Refer to Section VI for parts replacement and -hp- part number information.

5-42. The etched circuit boards are of the plated-through type. The electrical connection between the two sides of the board is made by a layer of metal plated through the component hole. When working on these boards, observe the following rules:

- a. Use a low-heat (25 to 30 watts) small-tip soldering iron, and a small diameter rosin core solder.
- b. Remove circuit components by placing the soldering iron on the component lead on either side of the board, and pulling up on the lead. If a component is obviously damaged, clip leads off as close to the component as possible and then remove leads with a soldering iron.

EXCESSIVE HEAT CAN CAUSE THE
CIRCUIT AND BOARD TO SEPARATE
OR CAUSE DAMAGE TO THE COM-
PONENTS.

- c. Clean component lead hole by heating the hole with the iron and inserting a wooden toothpick.

Remove the toothpick after the solder has cooled and insert the new component lead.

- d. To replace components, shape new leads and insert them in lead holes. Reheat the soldering iron and add a small amount of new solder as required to insure a good electrical connection.
- e. Clean excessive flux from the connection and adjoining area.

5-43. SERVICING ROTARY SWITCHES.

5-44. The 331A/332A has four rotary type switches: FUNCTION, SENSITIVITY, FREQUENCY RANGE, and METER RANGE. When working on these switches, observe the following rules:

- a. Use a low-heat (25 to 50 watts) small-tip soldering iron, and a small diameter rosin core solder.
- b. When replacing components, attempt to dress them as nearly to their original alignment as possible.
- c. Clean excessive flux from the connection and adjoining area.
- d. After cleaning the switch, apply a light coat of lubriplate to the switch detent balls. DO NOT apply lubricant to the switch contacts or allow lubricant to contaminate components.

PERFORMANCE CHECK TEST CARD

Hewlett-Packard Model 331A/332A
Distortion Analyzer
Serial No. _____

Test performed by _____
Date _____

DESCRIPTION	CHECK										
1. Fundamental Rejection Check: 500 Hz, 5 kHz, 50 kHz, 250 kHz, 600 kHz	<u>Specification</u> >-80 dB	<u>Indication</u> ☐									
2. Second Harmonic Accuracy Check: 15 Hz 10 kHz 50 kHz 200 kHz 500 kHz	<u>Specification</u> <+1.0 dB <±0.6 dB <-1.0 dB <-2.0 dB <-3.0 dB	<u>Indication</u> ☐ ☐ ☐ ☐ ☐

SECTION VI

REPLACEABLE PARTS

6-1. INTRODUCTION.

6-2. This section contains information for ordering replacement parts. Table 6-1 lists parts in alphabetic order of their reference designators and indicates the description, -hp- part number of each part, together with any applicable notes, and provides the following:

- a. Total quantity used in the instrument (TQ column). The total quantity of a part is given the first time the part number appears.
- b. Descriptions of the part. (See list of abbreviations below.)
- c. Typical manufacturer of the part in a five-digit code. (See Appendix for list of manufacturers.) Parts that are manufactured by Hewlett-Packard are identified by the abbreviation -hp-.
- d. Manufacturer's part number.

6-3. Figures 6-1 through 6-3 illustrate the replaceable mechanical parts used in the 331A/332A. Miscellaneous parts are listed at the end of Table 6-1.

6-4. ORDERING INFORMATION.

6-5. To obtain replacement parts, address order or inquiry to your local Hewlett-Packard Field Office. (See Appendix for list of office locations.) Identify parts by their Hewlett-Packard part numbers. Include instrument model and serial numbers.

6-6. NON-LISTED PARTS.

6-7. To obtain a part that is not listed, include:

- a. Instrument model number.
- b. Instrument serial number.
- c. Description of the part.
- d. Function and location of the part.

SECTION VII CIRCUIT DIAGRAMS

7-1. INTRODUCTION.

7-2. This section contains circuit diagrams to aid in the operation and maintenance of the Models 331A and 332A. Figures 7-1 through 7-4 contain detailed schematic diagrams as well as component location drawings

of each printed circuit board.

7-3. General schematic notes, which apply to all the schematic diagrams, are listed on page 7-2.

7-4. An explanation of terms and symbols used on the schematic diagrams is given below.

REFERENCE DESIGNATIONS

GENERAL SCHEMATIC NOTES

1. PARTIAL REFERENCE DESIGNATIONS ARE SHOWN. PREFIX WITH ASSEMBLY OR SUBASSEMBLY DESIGNATION(S) OR BOTH FOR COMPLETE DESIGNATION.

2. COMPONENT VALUES ARE SHOWN AS FOLLOWS UNLESS OTHERWISE NOTED:

RESISTANCE IN OHMS

CAPACITANCE IN MICROFARADS

3.  DENOTES CHASSIS GROUND.

4.  Denotes Earth Ground.

5.  DENOTES SIGNAL GROUND (FLOATABLE).

6.  SIGNAL GROUND (ON BOARD).

7.  DENOTES ASSEMBLY.

8.  DENOTES MAIN SIGNAL PATH.

9.  DENOTES FEEDBACK PATH.

10.  DENOTES FRONT PANEL MARKING.

11.  DENOTES REAR PANEL MARKING.

12.  DENOTES SCREWDRIVER ADJUST.

13.  -DENOTES FRONT PANEL CONTROL.

14. * AVERAGE VALUE SHOWN, OPTIMUM VALUE SELECTED AT FACTORY.

15.  DENOTES COMPONENTS NOT MOUNTED ON ASSEMBLY.

16.  DENOTES TROUBLESHOOTING INFORMATION LOCATED ON APRON PAGE OF RESPECTIVE SCHEMATIC.

17.  DENOTES SIGNAL CONNECTION.

18.  DENOTES SCHEMATIC ON WHICH SIGNAL CONNECTION IS MADE.

and RF Detector (P/O A4)
7-3

TROUBLESHOOTING INFORMATION

When checking the voltages and waveforms for this circuit, set the 331A/332A controls as follows, unless otherwise noted:

- FUNCTION SET LEVEL
- METER RANGE 0.3 VOLTS
- SENSITIVITY MAX.
- SENSITIVITY VERNIER MAX.
- FREQUENCY RANGE X100
- Frequency Dial 10
- Input Signal 0.3 V rms at 1 kHz

280 mV rms at pin 1.

180 mV rms at pin 7. In DISTORTION function, with input nulled, signal at pin 7 should change to 2.4 V rms. Use a 10 MΩ/10 pF impedance probe for this measurement.

0 V rms at pin 8. In DISTORTION function but not nulled (frequency dial set to 50), signal at pin 8 changes to 310 mV rms. Use a 10 MΩ/10 pF impedance probe for this measurement.

0.32 V rms at pin 2.

BACKDATING INFORMATION

1. Change A3R3 to 12 kΩ for instruments prefixed 827- (821- for 332A) and below. Refer to Change 7, Appendix C.
2. Instruments with serial number 914-03825 and below (909-01710 and below for 332A) the A3 Assembly was part number 00331-66503. To make this schematic compatible with earlier instruments, change A3R13 to 7500 Ω, change A3R14 to 2.49 kΩ, delete A3R31, A3R32, A3R33, A3R30, A3CR1 and delete R13 (off board, connected to pin 10.)
3. Instruments with serial no. 982-04301 (985-01911 and below for 332A) did not have A3R35 and A3R36. Refer to Appendix C for more information.
4. See Change No. 16 in Appendix C.
5. See Change No. 15 in Appendix C.

Model 331A/332A

Section VII

331A/332A-8-00024

Figure 7-2. Rejection Amplifier (A3) 7-5

2
Figure 7-2. Rejection Amplifier (A3)
7-5

TROUBLESHOOTING INFORMATION

1 mV rms between pins 6 and 15 for full scale deflection on the 0 to 1 scale on the 0.001 V to 300 V ranges. 300 μ V rms between pins 6 and 15 for 300 μ V indication on 300 μ V range.

533A-B-1471

BACKDATING INFORMATION

1. Only on instruments prefixed 716- (717- for 332A) and above. Refer to Change 3, Appendix C.
2. Only on instruments prefixed 827- (821- for 332A) and above. Refer to Change 4, Appendix C.
3. A2Q2 and A2C19 changed on prefix 827- (821- for 332A) and below. Refer to Change 7, Appendix C.
4. A2R3/R20/R39 are different in some earlier instruments and are not directly interchangeable with the ones listed in Table 6-1. See Appendix C for applicable serial numbers.

331A/332A-P-03321

Figure 7-4. Power Supply (A1)
7-9/7-10

BACKDATING INFORMATION

1. R12 was located on the A1 Assembly and designated as A1R1. The resistor was connected between pins 10 and 11 on A1. See Appendix C, Change #9 for applicable serial numbers.
2. R9 is added here on Instruments prefixed 827- (821- for 332A) and below. Refer to Change 7, Appendix C.
3. Value changed on serials 827-03000 (821-01385 for 332A) and below. Refer to Change 6, Appendix C.
4. C8 is added to Instruments whose serial number is 602-00820 (536- for 332A) and below. Refer to Change 1, Appendix C.
5. A1R13 was different in some earlier Instruments and is not directly interchangeable with the one listed in Table 6-1. See Appendix C for applicable serial numbers.
6. In some earlier Instruments A1R6 was 12.1 kΩ and A1R7 was 12.7 kΩ. To improve power supply regulation these resistors should be changed to the values shown in Figure 7-4. See Appendix C for applicable serial numbers.

CODE LIST OF MANUFACTURERS

The following code numbers are from the Federal Supply Code for Manufacturers Cataloging Handbooks H4-1 (Name to Code) and H4-2 (Code to Name) and their latest supplements. The date of revision and the date of the supplements used appear at the bottom of each page. Alphabetical codes have been arbitrarily assigned to suppliers not appearing in the H4 Handbooks.

Code No.	Manufacturer	Address	Code No.	Manufacturer	Address	Code No.	Manufacturer	Address

MANUAL BACKDATING CHANGES

MODEL 331A/332A DISTORTION ANALYZER

Manual Serial Prefixed: 995-(331A), 998-(332A)
-hp- Part No. 00331-90006

This manual backdating sheet makes this manual applicable to earlier instruments. Instrument-component values that differ from those in the manual, yet are not listed in the backdating sheet, should be replaced using the part number given in the manual.

331A		332A	
Instrument Serial Prefix	Make Manual Changes	Instrument Serial Prefix	Make Manual Changes
427-, 517-, 536-	1 thru 18	427-, 504-, 517-	1 thru 18
602-00820 and below*	1 thru 18	536-	1 thru 18
602-	3 thru 18	604-00525 and below	3 thru 18
716-02100 and below	3 thru 18	604-, 717-, 748-	4 thru 18
716-, 724-, 801-	4 thru 18	821-01360 and below	5 thru 18

*And the following instruments above 602-00820:		602-00823 thru 602-00829 602-00833	602-00837 602-00846
			602-00869 602-00899

CHANGE 1 Table 6-1:

Add A1C8, C: fxd 2200 pF $\pm 20\%$ 500 vdcw, -hp- Part No. 0150-0085.

Figure 7-4, Power Supply Schematic:

Add capacitor, A1C8, 2200 pF, between cathode of A1CR7 and base of A1Q5.

CHANGE 2 Table 6-1:

Change A4 board, -hp- Part No. from 00332-66502 to 00332-66501.

Add A4L3, A4C4 and A4R1 on A4 board.

Delete C9, -hp- Part No. 0140-0206, C: fxd dipped mica 270 pF $\pm 5\%$ (332A only). Use description for A4C4.

Delete R10, -hp- Part No. 0686-1324, R: fxd comp 1300 ohms $\pm 5\%$ 1/2 W (332A only). Use description for A4R1.

Delete L4, -hp- Part No. 9170-0805, Coil: fxd 1.6 mH (332A only). Use description for A4L3; change -hp- Part No. to 9170-0461.

Delete R8, -hp- Part No. 0683-5125, fxd comp 5100 Ω and add S7R8 (same description). Change Shield: bottom, -hp- Part No. 00331-04102 to Plate: cover, -hp- Part No.

00331-04101.

Figure 7-1:
Change RF Input Circuitry to the following:

CHANGE 3 (For instruments having A2 boards with -hp- Part No. 00331-66502 or 00331-66504 only)
Figure 7-3:

Delete A2C30, A2CR8, and A2R51 from circuit.

Table 6-1:

Delete A2C30, A2CR8, and A2R51.

CHANGE 4 Table 6-1:

Delete A2R18 and A2R19.

Add A2CR5, 1901-0025, Diode: Si 50 mA $\pm$ 1 V 100 piv.

Change A2Q1 to 1855-0082.

Figure 7-1:

Delete A2R18 from circuit. Replace with diode A2CR5.

Figure 7-3:

Delete A2R19 from circuit.

CHANGE 5 Figure 6-3:

Change index no. 29 to -hp- Part No. 00331-23702.

Change index no. 30 to Yoke: flex coupler -hp- Part No. 1500-0002.

Add: shim spacer -hp- Part No. 5000-4994 (2 each).

Change index no. 31 to -hp- Part No. 5040-0212.

(For smoother drive use current part no. for all three parts.)

CHANGE 6 Table 6-1 and Figure 7-1:

Change C2, C5 and C7 to 0.01 μ F, 1 kV, -hp- Part No. 0150-0012. (To present a lower impedance at power line frequency use current values).

CHANGE 7 Table 6-1:

Change A2Q7 to -hp- Part No. 1854-0215 (interchangeable with 1854-0019).

Table 6-1 and Figure 7-1:

R11 and insulator at J1 ground terminal ($\frac{1}{2}$) are removed and R11 is replaced by a short. The same resistor (as R9) is added between J4 ground connector and power line ground ($\frac{1}{2}$).

Change A2C19 to 680 pF, -hp- Part No. 0140-0208. (To raise frequency response at 1 MHz use current value).

Change A3R3 to 12 k Ω , -hp- Part No. 0686-1235. (To extend the range of A3R4 use current value.)

CHANGE 8 Table 6-1:

Change A2Q2 to -hp- Part No. 1853-0086. (For less distortion use current part no.)

CHANGE 9 R12 was located on the A1 Assembly and designated as A1R1 on instruments with serial numbers 914-03625 and below with the following instruments excluded: for the 331A, SN 914-03526, -03530, -03538, -03544, -03545, -03547, -03549, -03552, -03582, -03584, -03586, -03587, -03588, -03590, -03598, -03599, -03600, -03604, -03611 and -03625.

For the 332A, all instruments with Serial Number 909-01590 and below have the resistor mounted on the A1 Assembly.

For replacement purposes, use the resistor listed in Table 6-1 as R12.

Manual Backdating Changes Model 331A/332A Page 3

- CHANGE 10 In instruments with Serial Number 914-03725 and below (909-01670 and below for 332A) A2Q3 was different. For replacement purposes, use the transistor listed in Table 6-1 as A2Q3.
- CHANGE 11 In instruments with Serial Number 914-03825 and below (909-01710 and below for 332A) the A3 Assembly was Part No. 00331-66503. To make the A3 schematic in this manual compatible with these serial numbered instruments, make the following changes:
1. Change A3R13 to 7500 Ω .
 2. Change A3R14 to 2.49 k Ω .
 3. Delete A3R30, A3R31, A3R32, A3R33, A3CR1 and delete R18 (connected to A3 pin 10, off board).
- The new 00333-66503 board may be used in the above mentioned instrument provided a 20 k Ω resistor (R13) is connected between A3 pin 10 and ground as shown on schematic #2 in this manual.
- CHANGE 12 Page 6-11:
Change the Part Number of cable W1 to 8120-0078.
Change the Part Number of the power connector from 1251-2357 to 1251-1009.
The power cords are not directly interchangeable.
- Figure 6-2:
Change the Part Number of the 331A rear panel to 00331-00202. Change the Part Number of the 332A rear panel to 00332-00202.
- CHANGE 13
Change the Part Number of A1R13 to 2100-1434.
Change the Part Number of A2R3 to 2100-0094.
Change the Part Number of A2R20 to 2100-0092.
Change the Part Number of A2R39 to 2100-0151.
These resistors are not directly interchangeable with the ones listed in Table 6-1.
- CHANGE 14 In some earlier instruments A1R6 was 12.1 k Ω and A1R7 was 12.7 k Ω . To improve power supply regulation, both of these resistors should be changed to the values shown in Table 6-1.
- CHANGE 15 Figure 7-2:
Delete A3R35 and A3R36. Replace with a short. Delete these components from Table 6-1.
Change A3R16 to 3.3 k Ω and delete A3R34. Delete A3R34 from Table 6-1.
- CHANGE 16 Figure 7-2:
Change Schematic as follows:
- 
- Delete A3R37, 47 k Ω .
Add A3R30 to Table 6-1
Part No. 2100-0360, R: var, 100 k Ω 30% 1/8 W
- CHANGE 17
Change the rear panel Part No. as follows:
331A to 00331-00203
332A to 00332-00203
- CHANGE 18 Table 6-1 and Figure 7-2:
Change A3Q3 and A3Q5 to part no. 1854-0354
Change A3C4 to 30 pF, part no. 0140-0203
