10 kHz to 1 GHz AM/FM Signal Generators

2022A&C

- Wide frequency cover: 10 kHz to 1 GHz
- ☐ +13 dBm output (2022C)
- ☐ Small, light and rugged for portability
- Non-volatile memory with 100 settings
- Powerful second functions for rapid fault finding and calibration

- Comprehensive amplitude, frequency and phase modulation
- ☐ Simple operation
- ☐ Reverse power protection up to 50 W
- Choice of output calibration units
- Optional GPIB programmability

2022A and 2022C Signal Generators are compact, lightweight units offering frequency, phase and amplitude modulation over the frequency range 10 kHz to 1 GHz. Output levels up to +13 dBm are offered on the 2022C and +6 dBm on the 2022A. The units are designed for a wide range of applications in research development, production and maintenance. Microprocessor control provides simple and rapid operation by direct keyboard entry of settings. The nonvolatile memory, which can store up to one hundred settings, further reduces measurement time. Full GPIB

programmability adds greater flexibility and faster throughput in systems applications.

SIMPLE OPERATION

A simple keyboard layout ensures easy operation. All parameters are set using the numeric keys, while up and down keys allow the values to be varied in steps of any size. A TOTAL SHIFT key displays the deviation from the original setting and a RETURN key returns the selected parameter to the original value. All front-panel

7 & 8	Not used.			
9	Read elapsed time.			
10	Record external frequency standard choice.			
11	Read instrument identity string.			
12	Write via GPIB a user- defined string stored in non-volatile memory.			
13	Read user-defined string via GPIB.			
14	Display/change RF level units (i.e. voltage EMF or PD and dB reference).			
15	Display/change RF level calibration offset.			
16	Specify start-up with instrument settings from store 10.			
17 & 18	Not used.			

Functions 10 to 18 inclusive are protected functions.

190 Set identity string,
displayed by SF11.

191 to 194 Calibration of FM tracking,
RF level, voltage tuned
filters and AM.

195 to 199 Other Second Functions
reserved for calibration and
servicing.

Functions 190 to 199 are doubly protected functions intended for use in manufacture and servicing only.

Displays A

A single liquid crystal display provides simultaneous readout of Carrier Frequency, Modulation and RF Level.

Carrier frequency: 7 digit display with annunciators to show frequency units, external frequency standard, GPIB service requests, frequency limit exceeded, remote operation and instrument addressed.

Modulation display: 3 digit display with annunciators to show modulation units FM. ØM. AM, modulation off and external modulation selected.

RF level display: 4 digit display with annunciators to show RF level units, RF output off and reverse power trip operated.

GPIB INTERFACE

A GPIB interface is available as an accessory. All functions except the supply switch are remotely programmable.

Capabilities

Complies with the following subsets as defined in IEEE 488-1978 and IEC Publication 625-1. SH1, AH1, T6, TE0, L4, LE0, SR1, RL1,

PP0, DC1, DT0, C0, E1.

RADIO FREQUENCY INTERFERENCE Conforms with the requirements of EEC directive 76/889 as to limits of r.f. interference.

SAFETY

Complies with IEC 348.

RATED RANGE OF USE (Over which full specification is met)

Temperature

0 to 55°C.

CONDITIONS OF STORAGE AND TRANSPORT

Temperature 40°C to +70°C.

Humidity

Up to 90% relative humidity.

Altitude

Up to 2500 m (pressurised freight at 27 kPa differential, i.e. 3-9/bf/in²).

AC Supply

Switchable voltage ranges 105 to 120 V, 210 to 240 V, all \pm 10%. 45 to 440 Hz.

55 VA maximum

DIMENSIONS AND WEIGHT (not including handle forward projection)

Height Width Depth Weight 152 mm 256 mm 367 mm 7-5 kg 6 in 10·25 in 14·5 in 16·5 lb

Stored status information

Status information stored includes: internal/external standard; GPIB address; type and serial number. Elapsed time indicators are also accessed via the internal memories. One stores the number of operational hours since the instrument was manufactured and cannot be altered. The other records the number of elapsed hours since the clock was last reset; re-settings being accomplished using a secure Second Function.

Stored user-defined information

In GPIB operation the non-volatile memory may be used to store a user-defined string. Up to 32 ASCII characters may be written to, or read from the unit, for example to record the instrument's inventory information, date of last calibration, normal instrument location etc.

PROGRAMMING

2022A and 2022C can be simply fitted at any time with the optional GPIB interface so that all functions can be controlled over the bus. The instruments function as talker as well as listener. In the listen mode the generator's functions are set by simple instructions, and in the talk mode strings of information containing details of the instrument's settings can be sent back over the bus, allowing the controller to learn settings for later use.

Ease of programming

Ease of programming is ensured by careful selection of mnemonics. For example to send a carrier frequency of 123.456 MHz, an FM deviation of 3.5 kHz and an output level of 1.74 µV, and to place these settings in store 10 of the memory, it is only necessary the bus the instruction send over CF123.456MZ,FM3.5KZ,LV1.74UV,ST10. The use of commas as delimiters in the instruction string is not essential but often aids interpretation of program lines.

Controlled service requests

Service requests (SRQs) are sent for a variety of reasons including reverse power protection tripped and illegal characters received. SRQs may be inhibited if desired by setting flags in the generator using a Second Function.

SECOND FUNCTIONS

The front panel Second Function key gives access to a number of different features available with 2022A and calibration and programmable operation via GPIB. To prevent accidental interference with the contents of internal memories, those Second Functions that enable the internal data to be altered are protected by a secure key sequence.

Protected calibration data

Two levels of protection are offered, appropriate to the Second Function being accessed. The most secure is reserved for Second Functions that alter the instrument's calibration data, change its identity string, protect its store settings or blank the displays when memories are recalled. Less severe is the first level of protection. which enables the user to access those Second Functions that do not affect the fundamental calibration, but which may be relevant to normal operation. Examples include the selection of: RF level calibration units, RF level offsets, external standard frequency and switchon status.

Additional operating features

In addition, unprotected Second Functions provide a range of additional operating features, such as the ability to display status information, elapsed time and the type and serial number.

MAINTENANCE AND CALIBRATION

The Second Function mode provides powerful fault diagnostic facilities from the front panel or via the GPIB by allowing the operator to send data directly to individual latches in the instrument. The resulting changes in output conditions can be monitored and the area in which the fault lies can be localized quickly.

Automatic calibration

RF level, f.m. accuracy and frequency accuracy can be adjusted without removing the instrument's covers. Level and FM accuracy can be adjusted over the GPIB, leading to fully automated calibration routines.

Rapid repair

Careful mechanical design of the instrument ensures rapid access to all circuits for PCB or component replacement. The main RF assemblies are easily removed for inspection and repair. Printed boards interconnect by means of plugs and sockets, so simplifying first-line maintenance.

GENERAL DESCRIPTION

2022A and 2022C are synthesized signal generators covering the frequency range 10 kHz to 1 GHz. The output may be amplitude, phase or frequency modulated using either the built-in AF source or an external signal. All control settings are entered from a front panel keyboard. A single liquid crystal display gives simultaneous readout of frequency modulation and output level. Remote control via the General Purpose Interface Bus is available as an option.

CARRIER FREQUENCY

Range Selection 10 kHz to 1 GHz. By keyboard entry.

Indication

functions are available from GPIB when the optional GPIB interface board is fitted. Frequency, phase and amplitude modulation are selected by operation of the appropriate key, and for rapid measurements of receiver signal-to-noise ratio the modulation can be switched on and off using the MOD ON-OFF key. Provision is made for operation with an external reference frequency of 1 MHz, 5 MHz or 10 MHz as required.

DISPLAY

Measurement settings are indicated on a large liquid crystal display, offering clarity and low power consumption. The display features 7-digit resolution for carrier frequency, 3 digits for modulation and 4 for RF level, with units annunciators for unambiguous reading. Status and diagnostic information are also shown. Carrier frequency, modulation and RF level are all shown together.

OUTPUT

RF output levels up to \pm 13 dBm can be set on the 2022C (up to \pm 6 dbm on 2022A) in all modulation modes by direct keyboard entry or via the GPIB with a resolution of at least 0.1 dB over the entire range. Total level accuracy is \pm 1 dB for output levels above \pm 1 dBm and \pm 2 dB below \pm 10 dBm. Levels are indicated on a four-digit liquid crystal display with units annunciators and levels can be incremented in steps of any size.

Calibration data held in memory

A choice of seven calibration units is available to the operator and provision is made for the simple conversion of units (e.g. dBm to μV). Calibration data for the output level is held in the memory and may be altered from the front panel or over the interface bus.

Offset facility

The output level can be offset by up to ± 2 dB from the calibrated value to compensate for cable or switching losses external to the generator. The operator may also use this facility as a means of deliberately offsetting the output level to ensure that all generators in an area give identical measurements. While using the offsetting facility the main calibration of the generator is not lost and may be returned to at any time.

REVERSE POWER PROTECTION

An electronic trip protects the generator output against reverse power of up to 50 W, preventing damage to output circuits when RF or DC power is accidentally applied. This feature contributes to long unit life and low cost-of-ownership.

MODULATION

Comprehensive AM, FM and ØM facilities are provided for testing all types of receivers. A MOD ON-OFF key is fitted to allow signal-to-noise ratio checks to be made.

FM, AM and phase modulation

The wide range frequency modulation facility provides FM deviation up to a maximum of 99.9 kHz depending on modulation and carrier frequency, and excellent FM

accuracy is assured by the storage of calibration values in the memory. Phase modulation is available with a deviation range of up to 9.99 radians and amplitude modulation is provided with steps of 0.5% up to 99.5% depth.

External modulation

External modulation is possible with a wide band input of 50 Hz to 50 kHz for FM, 50 Hz to 10 kHz for ØM and 20 Hz to 15 kHz (DC coupled) for AM. The characteristics of the FM input allow the digital signals commonly used in mobile radio to be handled. A modulation levelling function is included which can be disabled when not required. HI and LO indications show when the input level is outside the range of the ALC system.

Auxiliary modulation input

2022C is fitted with a rear panel auxiliary modulation input socket which allows an external modulation signal (e.g. a sub-audible signalling tone) to be mixed with the internal signal.

INCREMENTING

All parameters can be incremented or decremented in steps of any size, which may be simply entered via the keyboard or GPIB. If no step size is entered for a parameter the steps are pre-set to 1 kHz for carrier frequency, 1 kHz for FM deviation, 1 radian for ØM deviation, 1% for AM depth and 1 dB for output level.

Single key operation

A single tap on either the UP or DOWN key moves the parameter by one step. If the key is held down the parameter steps once, waits one second and then moves at three steps per second. For search purposes it is possible to reverse this stepping direction without the one second delay.

TOTAL SHIFT key

Operation of the TOTAL SHIFT key displays the variations in all parameters from their original settings. Use of the RETURN key sets the selected parameter back to its start value.

NON-VOLATILE MEMORY

The inclusion of a true non-volatile semiconductor memory for storage of up to twenty complete generator settings and a further eighty carrier frequencies ensures that settings are retained even when the generator is switched off, without relying on a battery. Any of the sets of data can be instantly recalled when required for later use and the UP/DOWN keys may be used to step through a sequence of tests. A further feature enables a single group of preset measurement values to be recalled automatically at switch-on.

Stored calibration data

In addition to storage and recall of measurement settings, non-volatile memory contains other useful data. Calibration data — on RF level, FM accuracy and RF calibration units — are retained in these stores and may be altered using protected Second Functions. Output level offset values are also retained in the instrument's memories and may be selected or deselected by Second Function operation.
